by a thorough study of the posterior analytics and related aristotelian texts richard mckirahan reconstructs aristotle s theory of episteme science the posterior analytics contains the first extensive treatment of the nature and structure of science in the history of philosophy and mckirahan s aim is to interpret it sympathetically following the lead of the text rather than imposing contemporary frameworks on it in addition to treating the theory as a whole the author uses textual and philological as well as philosophical material to interpret many important but difficult individual passages a number of issues left obscure by the aristotelian material are settled by reference to euclid s geometrical practice in the elements to justify this use of euclid mckirahan makes a comparative analysis of fundamental features of euclidian geometry with the corresponding elements of aristotle s theory emerging from that discussion is a more precise and more complex picture of the relation between aristotle s theory and greek mathematics a picture of mutual rather than one way dependence originally published in 1992 the princeton legacy library uses the latest print on demand technology to again make available previously out of print books from the distinguished backlist of princeton university press these editions preserve the original texts of these important books while presenting them in durable paperback and hardcover editions the goal of the princeton legacy library is to vastly increase access to the rich scholarly heritage found in the thousands of books published by princeton university press since its founding in 1905

this radical profoundly scholarly book explores the purposes and nature of proof in a range of historical settings it overturns the view that the first mathematical proofs were in greek geometry and rested on the logical insights of aristotle by showing how much of that view is an artefact of nineteenth century historical scholarship it documents the existence of proofs in ancient mathematical writings about numbers and shows that practitioners of mathematics in mesopotamian chinese and indian cultures knew how to prove the correctness of algorithms which are much more prominent outside the limited range of surviving classical greek texts that historians have taken as the paradigm of ancient mathematics it opens the way to providing the first comprehensive textually based history of proof
