animal learning and human learning traditions have been distinguishable within psychology since the start of the discipline and are to this day the human learning wing was interested in the development of psychological functions in human organisms and proceeded directly to their examination the animal learning wing was not distinguished by a corresponding interest in animal behavior per se rather the animal learners studied animal behavior in order to identify principles of behavior of relevance to humans as well as other organisms the two traditions in other words did not differ so much on goals as on strategies it is not by accident that so many techniques of modern applied psychology have emerged from the animal laboratory that was one of the ultimate purposes of this work from the very beginning the envisioned extension to humans was not just technological however many animal researchers b f skinner most prominently among them recognized that direct basic research with humans might ultimately be needed in certain areas but that it was wise first to build a strong foundation in the controlled environment of the animal laboratory in a sense animal learning was always in part a human research program in development

on parent s day in 1952 b f skinner visited his daughter s fourth grade math class as he watched the lesson he became increasingly uncomfortable almost every principle of effective teaching that he had studied for more than 20 years was being violated in that classroom yet it was a typical class the teacher showed how to solve the day s problems then gave the students a worksheet to do some children began to work readily while others shifted uncomfortably in their chairs or raised their hands for help the teacher went from desk to desk giving help and feedback skinner knew what was needed each student should be given a problem tailored precisely to his or her skill level not to the class average and every answer needed to be assessed immediately to determine the next step the task was clearly impossible for one teacher that afternoon skinner set to work on a teaching machine today s computers have made the mechanical machine obsolete but the principles of how to design instruction in steps that lead from a basic level to competent performance are as valid today as they were in the 20th century this book brings together skinner s writings on education during the years he was most involved in improving education
