Categorical Versus Dimensional Models of Affect

2012

one of the most important theoretical and empirical issues in the scholarly study of emotion is whether there is a correct list of basic types of affect or whether all affective states are better modeled as a combination of locations on shared underlying dimensions many thinkers have written on this topic yet the views of two scientists in particular are dominant the first is jaak panksepp the father of affective neuroscience panksepp conceptualizes affect as a set of distinct categories the leading proponent of the dimensional approach in scientific psychology is james russell according to russell all affect can be decomposed into two underlying dimensions pleasure versus displeasure and low arousal versus high arousal in this volume panksepp and russell each articulate their positions on eleven fundamental questions about the nature of affect followed by a discussion of these target papers by noted emotion theorists and researchers russell and panksepp respond both to each other and to the commentators the discussion leads to some stark contrasts with formidable arguments on both sides and some interesting convergences between the two streams of work

Fifth-Dimensional Soul Psychology

greetings i m vywamus i m a soul psychologist in this series of lectures we will explore the meaning of soul psychology and how it relates to modern psychology more importantly we will show how soul psychology as a practice is becoming more popular and is an especially useful technique for starseeds and others who are awakening to the fact that there is reincarnation and that there are soul lessons that must be learned the basic essence of soul psychology rests with the idea that the soul is evolving and that part of this evolution is occurring through incarnations in the third dimension now to even speak about the soul evolving is perhaps a controversial subject because we know that the soul is eternal we know that the soul has been in existence for infinity and we know that the soul is perfect so why would the soul have to evolve the answer to this question is complex and we may not be able to totally answer it using third dimensional terminology but it is an important question to answer because the nature of soul evolution is inherently connected to your experiences in the third dimension on the soul

this book presents an innovative approach to clinical assessment in

psychiatry based on a number of psychopathological dimensions with a presumed underlying pathophysiology that are related to fundamental phenomenological aspects and lie on a continuum from normality to pathology it is described how the evaluation of these dimensions with a specific validated rapid assessment instrument could easily integrate and enrich the classical diagnostic dsm 5 or icd 10 assessment the supplemental use of this dimensional approach can better capture the complexity underlying current categories of mental illness the findings from a large patient sample suggest how this assessment could give a first glance at how variable and multifaceted the psychopathological components within a single diagnostic category can be and thereby optimise diagnosis and treatment choices being short and easy to complete this dimensional assessment can be done in a busy clinical setting during an ordinary psychiatric visit and in an acute clinical context with limited effort by a minimally trained clinician therefore it provides interesting and useful information without additional costs and allows research work to be performed even in difficult settings

a remarkable and extremely important ongoing positive revolution in how we think about psychological problems is rapidly reaching a tipping point this book provides a manifesto for this revolution an increasing number of psychologists and psychiatrists are proposing that we either radically change the next edition of the diagnostic and statistical manual of the mental disorders and the international classification of diseases or leave them behind entirely the author argues for a view of psychological problems that is far less stigmatizing and better supported by the data but which will require large changes in thinking first there is no clear distinction between normal and abnormal psychological functioning psychological problems do not reflect rare and terrifying illnesses of the mind but are problematic ways of thinking feeling and behaving that lie on continuous dimensions from minor to severe crucially psychological problems are ordinary aspects of the human experience they are ordinary in the sense of being commonplace the great majority of us will experience distressing and disruptive psychological problems at some time during our lives and are ordinary in arising through the same natural interplay of genetic and environmental influences as any other aspect of behavior the dimensions of psychological problems are highly correlated and these correlations provide vital clues as to what allow us to see a hierarchy of causes of psychological problems for the first time these range from factors that

influence the likelihood of exhibiting some kind of psychological problem but not which kind to highly specific causes

breakdown and breakthrough examines the essential role of regression in the patient's recovery from mental illness in light of this nathan field reassesses the role of the therapist tracing psychotherapy back to its earliest spiritual roots and comparing modern analytic methods with ancient practices of healing and exorcism the author uses vivid examples from his psychotherapeutic practice to show how with the apparent breakdown of the therapeutic method itself patients can break through to a new level of functioning the book goes on to consider how psychotherapy has been affected by fundamental developments in twentieth century science such as the move from old classical assumptions of linear causation to non linear complexity from reductionism to a holistic systems approach and from mental mechanisms to acknowledging the mysteries of unconscious interaction taking up the radical vision originally proposed by carl jung and later fostered by eminent psychotherapists such as winnicott and bion the author shows how psychotherapy can be reframed to admit the existence of a psychological fourth dimension nathan field reappraises ideas of health and pathology psychoanalysis and healing sex and spirituality in light of a dramatic shift in the way we understand ourselves how this shift alters the shape of psychotherapy in the twenty first century is the challenge the practitioners teachers and trainees must all address

this fine new book the third in a series brings psychologists up to date on the advances of phenomenological research methods in illuminating the nature of human awareness and experiences in the more congenial and welcoming intellectual climate of the 1990s the phenomenological methods have moved to the forefront of discourse on research methods that support and advocate an expanding view of science in valle and king 1978 phenomenological methods were presented as alternatives to behavioral methods in valle and halling 1989 phenomenological methods were advanced to perspectives in psychology this new volume is even less cautious indeed bolder in relation to conventional methods and epistemologies by now people knowledgeable about psychology and most psychologists have digested the criticisms directed against methods that operationalize quantify and often minimize human behavior in bringing us up to date on the growing power of the phenomenological methods this volume brings welcome coherence and integrity to an increasingly harried science attempting to reenchant itself with meaning and depth an endeavor artfully exemplified by phenomenological inquiries of the last several decades

originally published in 1992 this work compliments and extends the theory and results of nonlinear psychophysics an original approach created by the author it breaks with the traditional mathematics used in the experimental psychology of sensation and draws on what is popularly known as chaos theory and its extension into neural networks topical and innovative in its approach it integrates a diversity of topics previously treated separately into one framework the properties of the mathematics used are illustrated in the context of substantive problems in psychophysics thus it builds strong new bridges between the dynamics of mass action in psychophysical processes and the broader phenomena of sensation no other treatments of the topic take quite this approach the use of systems theory rather than traditional equations of psychophysics dating from the mid nineteenth century offers a striking contrast in both theory construction and data analysis

dsm iv and icd 10 both diagnose personality disorders categorically yet studies indicate that many patients meet criteria for an excessive number of diagnoses raising the question of whether personality disorders are discrete conditions or rather distinctions along dimensions of general personality functioning this collection of papers renews long standing proposals for a dimensional model of personality disorder describing alternative models addressing questions about their clinical application and utility and suggesting that future research seek to integrate such models within a common hierarchical structure with contributions by preeminent researchers in the field dimensional models of personality disorders is drawn from a conference series convened by apa who and nih in order to plan for the fifth edition of the dsm the nomenclature work group concluded that consideration should be given to basing part or all of dsm v on dimensions rather than categories and recommended that a dimensional model for personality disorders should serve as a basis for exploring dimensional approaches in other areas accordingly the volume opens with a presentation of 18 proposals for dimensional models and proceeds with provocative contributions on a number of related issues ranging from hard science to

clinical practice among the topics addressed are behavioral and molecular genetic research supporting an etiologically informed dimensional classification of personality disorders the as yet tenuous associations between dimensional trait measures of personality as contained in the models of cloninger depue and siever davis and specific neurobiological measures as examined in neurotransmitter research potential links between childhood and adolescent temperament and personality dimensions and adult personality psychopathology studies examining the covariation of personality dimensions across cultures the continuity of axis i and axis ii disorders and a proposed hierarchical structure of mental disorders that integrates the psychopathology of axis i disorders with specific personality traits the dual challenges of coverage and cutoffs that must be addressed if dimensional models are to be considered viable alternatives to the existing categorical diagnostic system although the editors acknowledge that concerns are certain to be raised regarding conversion to a dimensional classification such as the disruption to clinical practice by a radical shift in diagnosing personality disorder these papers make a strong case for opening the field to alternative ways of enhancing clinical utility and improving the validity of basic classification concepts together they offer stimulating insight into how we approach personality disorders with the hope of encouraging a new model of diagnosis for dsm v

dr eric c amberg introduces a new way of looking at the human condition that will radically change how readers think about well being and will enable them to better present themselves challenge labels and achieve a higher level of self realization the five dimensions of the human experience is a nonfiction presentation about the nature of who we are how we function and how we grow as human beings centered on five key components that overlap and interact to shape the human experience for every living person the biological mental genetic educational and energetic spiritual dimensions of being using research from the fields of psychology medicine genetics physics and spirituality and supporting his propositions with practical applications and real world results gleaned over the course of his career amberg delivers innovative insights on the concepts of life power individual evolution personal giftedness and our place within the psychosocial sphere written with every reader in mind and accessible to professionals and laypersons alike the five dimensions of the human experience extends an outstretched hand to anyone who wants to embrace the human condition and improve their quality of life dr eric c amberg began his career as a fifth grade teacher in new york city and later moved into the mental health industry where he has worked as an instructor and clinician for approximately thirty years he is currently working to develop an integrative program using a five dimensional approach to treat veterans with diagnoses such as posttraumatic stress disorder gulf war illness traumatic brain injury and chronic pain kirkus book review a schematic new analysis of the human condition basing his nonfiction debut on extensive experience in the mental health industry dealing with among other things patients with ptsd amberg likens the totality of the human experience to an extremely complex piece of machinery the parts of which need to be working in perfect alignment in order for the machine to function at its peak though humans are clearly much more complex than the machinery we create human life can malfunction and amberg has isolated five dimensions whose efficiencies are essential to the success of the whole the biological deals with physical health and well being the psychological encompasses all varieties of human interaction

the educational inevitably gives definition to who we are the genetic concentrates on dna which contains that which makes us special and the energetic connects humans to whatever they conceive of as god this is a spiritual rather than strictly religious book all denominations even atheists might find it thought provoking since amberger makes ample allowance for secular forms of inspiration the book takes an in depth look at each dimension in turn and given the author's specific area of expertise it's not surprising that a group of seven case studies is the book's most accomplished and rewarding section these case studies involve people struggling with challenges such as substance abuse learning disabilities and of course PTSD and amberger uses them to good effect as illustrations of the workings of the five dimensions he's sketched out these case studies also serve to highlight the element of personal accountability that runs through the whole book for amberger the more responsibility we are willing to assume the more access we have to our internal power and intelligence accessing that internal power he says can lead to self actualization there's a good deal of levelheaded common sense advice in these pages all of it presented more in the clear prose of a diagnostic manual than in the fuzzy generalities of a self help guide an analytical ultimately optimistic blueprint for taking charge of life and improving it
