margaret carr s seminal work on learning stories was first published by sage in 2001 and this widely acclaimed approach to assessment has since gained a huge international following in this new full colour book the authors outline the philosophy behind learning stories and refer to the latest findings from the research projects they have led with teachers on learning dispositions and learning power to argue that learning stories can construct learner identities in early childhood settings and schools by making the connection between sociocultural approaches to pedagogy and assessment and narrative inquiry this book contextualizes learning stories as a philosophical approach to education learning and pedagogy chapters explore how learning stories help make connections with families support the inclusion of children and family voices tell us stories about babies allow children to dictate their own stories can be used to revisit children s learning journeys can contribute to teaching and learning wisdom this ground breaking book expands on the concept of learning stories and includes examples from practice in both new zealand and the uk it outlines the philosophy behind this pedagogical tool for documenting how learning identities are constructed and shows through research evidence why the early years is such a critical time in the formation of learning dispositions margaret carr is a professor of education at the university of waikato new zealand wendy lee is director of the educational leadership project new zealand

in the era of covid 19 many people have suffered high levels of stress and mental health problems to cope with the widespread of suffering physical psychological social and economical the positive psychology of personal happiness is no longer the sole approach to examine personal wellbeing other approaches such as viktor frankl s theory of self transcendence provide a promising framework for research and intervention on how to achieve resilience wellbeing and happiness through overcoming suffering and self transcendence the existential positive psychology of suffering

complements the positive psychology of happiness which is championed by martin seligman as two equal halves of the circle of wellbeing and optimal mental health this research topic aims to examine the different approaches to positive psychology and their influence on individual wellbeing during the covid 19 era one of the exciting development in the positive psychology of wellbeing is the mounting research on the adaptive benefits of negative emotions such as shame guilt and anger as well as the dialectical process of balancing negative and positive emotions as an example based on all the empirical research and frankl s self transcendence model wong has developed the existential positive psychology of suffering pp2 0 as the foundation for flourishing here are a few main tenets of pp2 0 1 life is suffering and a constant struggle throughout every stage of development 2 the search for self transcendence is a primary motive guided by the meaning mindset and mindful mindset 3 wellbeing cannot be sustainable without overcoming and transforming suffering in this research topic we welcome diverse approaches discussing the following points the dialectic process of overcoming the challenges of every stage of development as necessary for personal growth and self transcendence the role of self transcendence in resilience virtue meaning and happiness the upside of negative emotions the new science of resilience based on cultivating the resilient mindset and character how to make the best use of suffering to achieve out potentials mental health

powerful and economic sensors such as high definition cameras and corresponding recognition software have become readily available e g for face and motion recognition however designing user interfaces for robots phones and computers that facilitate a seamless intuitive and apparently effortless communication as between humans is still highly challenging this has shifted the focus from developing ever faster and higher resolution sensors to interpreting available sensor data for understanding social signals and recognising users intentions psychologists ethnologists linguists and sociologists have investigated social behaviour in human human interaction but their findings are rarely applied in the human robot interaction domain instead robot designers tend to rely on either proof of concept or machine learning based methods in proving the concept developers effectively demonstrate that users are able to adapt to robots deployed in the public space typically an initial period of collecting human robot interaction data is used for identifying frequently occurring problems these are then addressed by adjusting the interaction policies on the basis of the collected data however the updated policies are strongly biased by the initial design of the robot and might not reflect natural spontaneous user behaviour in the machine learning approach learning algorithms are used for finding a mapping between the sensor data space and a hypothesised or estimated set of intentions however this brute force approach ignores the possibility that some signals or modalities are superfluous or even disruptive in intention recognition furthermore this method is very sensitive to peculiarities of the training data in sum both methods cannot reliably support natural interaction as they crucially depend on an accurate model of human intention recognition therefore approaches to social robotics from engineers and computer scientists urgently have to be informed by studies of intention recognition in natural human human communication combining the investigation of natural human behaviour and the design of computer and robot interfaces can significantly improve the usability of modern technology for example robots will be easier to use by a broad public if they can interpret the social signals that users spontaneously produce for conveying their intentions anyway by correctly identifying and even anticipating the user s intention the user will perceive that the system truly understands her his needs vice versa if a robot produces socially appropriate signals it will be easier for its users to understand the robot s intentions furthermore studying natural behaviour as a basis for controlling robots and other devices results in greater robustness responsiveness and approachability thus we welcome submissions that a investigate how relevant social signals can be identified in human behaviour b investigate the meaning of social signals in a specific context or task c identify the minimal set of intentions for describing a context or task d demonstrate how insights from the analysis of social behaviour can improve a robot s capabilities or e demonstrate how a robot can make itself more understandable to the user by producing more human like social signals

the world s population is predicted to hit 9 billion by 2050 and with it food demand is predicted to increase substantially the world bank estimates that cereal and meat production needs to increase by 50 and 85 respectively between 2000 and 2030 to meet demand putting serious pressure on the global agricultural industry critical to meeting this demand for food are mechanisms to reduce the incidence of animal disease with in excess of 1 3 billion cattle globally the total cost of infectious diseases is difficult to estimate however in north america alone the cost is predicted to be 18 billion

annually non infectious diseases also account for another major impediment to the production capacity and welfare of animals as well as the economic sustainability of farming however animal diseases have implications that spread far beyond the farm gate infectious agents can also contaminate the food chain and potentially affect human health controlling diseases through better preventative and treatment methods requires a detailed understanding of the immune response in livestock species multiple studies have identified associations between variation in immune genes and disease susceptibility which potentially opens up new avenues to select animals with superior disease resistance detailed understanding of immunity in cattle is leading to the design of more effective vaccines furthermore appreciation of the significant differences between rodent and human immune responses has also led to bovine models being developed for some human diseases the publication of the bovine genome and the advent of next generation sequencing technologies have facilitated a massive expansion in our knowledge of the immune response in cattle as a result there has been an explosion of exciting research findings including in metagenomics and epigenetics recently there has been a welcome move to integrate our emerging understanding of the immune response with detailed studies of other important physiological processes including nutrition and reproduction the interactions between the reproductive system nutrition and the immune system are of particular interest since each places significant demands on the animal at various stages through the production cycle the interplay between these morphologically diffuse systems involves widely distributed chemical signals in response to environmental input and each system must interact for the normal functioning of the other a comprehensive systems approach is improving our understanding of normal physiological interactions between these systems and furthermore how dysregulation can lead to disease the successful translation of bovine immunological research into improved treatments for animal disease requires tight interaction between diverse scientific and clinical disciplines including immunology microbiology endocrinology physiology nutrition reproduction and clinical veterinary medicine with so much recent progress in the field we believe that it is valuable and well timed to review the broad variety of the relevant studies that attempt to increase our understanding through comprehensive collaboration between these disciplines we are looking forward to a wide and vivid discussion of developments in bovine immunology and related issues and we expect that our readers profoundly benefit from new exciting insights and fruitful collaborations
