chosen for the 2011 asli choice honorable mention history category for a compendium of the key scientific papers that undergird the global warming forecast global warming is arguably the defining scientific issue of modern times but it is not widely appreciated that the foundations of our understanding were laid almost two centuries ago with the postulation of a greenhouse effect by fourier in 1827 the sensitivity of climate to changes in atmospheric co2 was first estimated about one century ago and the rise in atmospheric co2 concentration was discovered half a century ago the fundamentals of the science underlying the forecast for human induced climate change were being published and debated long before the issue rose to public prominence in the last few decades the warming papers is a compendium of the classic scientific papers that constitute the foundation of the global warming forecast the paper trail ranges from fourier and arrhenius in the 19th century to manabe and hansen in modern times archer and pierrehumbert provide introductions and commentary which places the papers in their context and provide students with tools to develop and extend their understanding of the subject the book captures the excitement and the uncertainty that always exist at the cutting edge of research and is invaluable reading for students of climate science scientists historians of science and others interested in climate change

climate change evidence and causes is a jointly produced publication of the us national academy of sciences and the royal society written by a uk us team of leading climate scientists and reviewed by climate scientists and others the publication is intended as a brief readable reference document for decision makers policy makers educators and other individuals seeking authoritative information on the some of the questions that continue to be asked climate change makes clear what is well established and where understanding is still developing it echoes and builds upon the long history of climate related work from both national academies as well as on the newest climate change assessment from the united nations intergovernmental panel on climate change it

touches on current areas of active debate and ongoing research such as the link between ocean heat content and the rate of warming

in 2001 a panel representing virtually all the world s governments and climate scientists announced that they had reached a consensus the world was warming at a rate without precedent during at least the last ten millennia and that warming was caused by the buildup of greenhouse gases from human activity the consensus itself was at least a century in the making the story of how scientists reached their conclusion by way of unexpected twists and turns and in the face of formidable intellectual financial and political obstacles is told for the first time in the discovery of global warming spencer r weart lucidly explains the emerging science introduces us to the major players and shows us how the earth s irreducibly complicated climate system was mirrored by the global scientific community that studied it unlike familiar tales of science triumphant this book portrays scientists working on bits and pieces of a topic so complex that they could never achieve full certainty yet so important to human survival that provisional answers were essential weart unsparingly depicts the conflicts and mistakes and how they sometimes led to fruitful results his book reminds us that scientists do not work in isolation but interact in crucial ways with the political system and with the general public the book not only reveals the history of global warming but also analyzes the nature of modern scientific work as it confronts the most difficult questions about the earth s future table of

essay from the year 2016 in the subject politics international politics environmental policy grade 1 egerton university public health course climate change language english abstract climate change seems to be a unique phenomenon owing to the numerous controversies surrounding it this is why there exists a great divide between environmentalists and their challengers over the issue of climate change to the present the debate on climate change has taken diverse perspectives in which the critical issue is whether climate change is a factual or false phenomenon in order to enhance understanding over the issue of climate change a number of international agencies have been formed one of the most proactive agencies that have immense contribution to the issue is the intergovernmental panel on climate change ipcc this scientific intergovernmental body was established in 1988 by the united nations environment programme unep and the world meteorological organization wmo following its endorsement by the un general assembly the same year ipcc became one of the organizations under the auspices of the un its core responsibility is to review and assess scientific socio economic and technical information related to climate change and prepare assessment reports for the united nations framework convention on climate change unfccc its reports focus on the risks of human induced

climate change as well as its potential socio economic and environmental impacts as such ipcc reports propose the most appropriate mitigation approaches to climate change since its inception ipcc has contributed immensely to the assessment of climate change therefore this paper provides a comprehensive discussion on ipcc s contribution to the climate change debate it will also present a critical assessment of the linkage between the agency s values and interests its advocacy positions and its use of science

guy stewart callendar 1898 1964 is noted for identifying in 1938 the link between the artificial production of carbon dioxide and global warming today this is called the callendar effect he was one of britain s leading steam and combustion engineers a specialist in infrared physics author of the standard reference book on the properties of steam at high temperatures and pressures and designer of the burners of the notable world war ii airfield fog dispersal system fido he was keenly interested in weather and climate taking measurement so accurate that they were used to

correct the official temperature records of central England and collecting a series of worldwide weather data that showed an unprecedented warming trend in the first four decades of the twentieth century he formulated a coherent theory of infrared absorption and emission by trace gases established the nineteenth century background concentration of carbon dioxide and argued that its atmospheric concentration was rising due to human activities which was causing the climate to warm Callendar's contributions to climatology led the way in the mid twentieth century transition from the traditional practice of gathering descriptive climate statistics to the new and exciting field of climate dynamics in the first half of the twentieth century the carbon dioxide theory of climate change which introduction had fallen out of favor with climatists

this collection pulls together key documents from the scientific and political history of climate change including congressional testimony scientific papers newspaper editorials court cases and international declarations far more than just a compendium of source materials the book uses these documents as a way to think about history while at the same time using history as a way to approach the politics of climate change from a new perspective making climate change history provides the necessary background to give readers the opportunity to pose critical questions and create plausible answers to help them understand climate change in its historical context it also illustrates the relevance of history to building effective strategies for dealing with the climatic challenges of the future

nathaniel rich's account starts in washington in the 1990s and tells the story of how climate change could have been stopped back then if only the powerful had acted but they didn't want to observe by 1979 we knew all that we know now about the science of climate change what was happening why it was happening and how to stop it over the next ten years we had the very real opportunity to stop it obviously we failed nathaniel rich tells the essential story of why and how thanks to the actions of politicians and businessmen that failure came about it is crucial to an understanding of where we are today the excellent and appalling *losing earth* by nathaniel rich describes how close we came in the 70s to dealing with the causes of global warming and how us big business and reaganite politicians in the 80s ensured it didn't happen read it john simpson an eloquent science history and an urgent eleventh hour call to save what can be saved nature to change the future we must first understand our past and *losing earth* is a crucial part of that when it comes to the environmental battles we're facing stylist

## **Making Climate Change History 2017-04-03**

seminar paper from the year 2019 in the subject politics environmental policy language english abstract the first part of this essay deals with the general issue of climate change and the un sustainable development goals having defined the general problem and impacts of climate change the essay then turns into a discussion of climate crises more based on an enterprise level the first part is about a critical assessment of corporate social responsibility csr in which recent literature of banerjee 2007 and levy spicer 2013 form the foundation the second part deals with alternative model that are proposing to solve the current climate crisis in terms of political economy for this purpose recent contributions from rockström et al 2017 and jackson 2009 were analysed in conclusion it appears that the only way to stop the climate change is through the revolution of energy the goal is a worldwide energy supply exclusively from renewable energy sources such as solar wind and hydro power this is primarily a task at governmental level that is directed and enforced by ufgcc regulations the climate change poses a major challenge to the

global community that can however only be tackled together every individual can contribute to this and many little deeds together will make a difference the essential point is that everyone is aware of this and is acting accordingly

cities concentrate wealth people and productivity while consuming much of the world's energy and producing much of the world's greenhouse gas emissions this concentration makes cities and their populations more at risk to natural disasters and to long term changes in climate yet cities also offer vast opportunities to respond to these challenges changes in migration land use and spatial development will increase vulnerability especially in developing countries and rising sea levels will affect millions of people living in coastal cities adaptation mitigation and increased resilience to climate change are therefore imperative for cities the links between cities and climate change were the subject of the 5th urban research symposium held in marseille france in june 2009 the eight papers selected and updated for cities and climate change responding to an urgent agenda reflect the core of the analytical discussion and policy implications discussed at the symposium combining comprehensive analysis and theoretical insights with examples of best practices from around the world these include a framework to include aspects of poverty in the discussion of cities and climate change new perspectives on the knowledge and measurement of climate change urban infrastructure institutions and governance and economic and social issues and specific case studies comparing experiences of cities in both industrialized and developing countries this book also includes a summary discussion of the main research themes and abstracts of additional selected papers from the symposium

## **Stop Global Warming 2019-11-08**

climate is changing forced out of the range of the past million years by levels of carbon dioxide and other greenhouse gases not seen in the earth's atmosphere for a very very long time lacking action by the world's nations it is clear that the planet will be warmer sea level will rise and patterns of rainfall will change but the future is also partly uncertain there is considerable uncertainty about how we will arrive at that different climate will the changes be gradual allowing natural systems

and societal infrastructure to adjust in a timely fashion or will some of the changes be more abrupt crossing some threshold or tipping point to change so fast that the time between when a problem is recognized and when action is required shrinks to the point where orderly adaptation is not possible abrupt impacts of climate change is an updated look at the issue of abrupt climate change and its potential impacts this study differs from previous treatments of abrupt changes by focusing on abrupt climate changes and also abrupt climate impacts that have the potential to severely affect the physical climate system natural systems or human systems often affecting multiple interconnected areas of concern the primary timescale of concern is years to decades a key characteristic of these changes is that they can come faster than expected planned or budgeted for forcing more reactive rather than proactive modes of behavior abrupt impacts of climate change summarizes the state of our knowledge about potential abrupt changes and abrupt climate impacts and categorizes changes that are already occurring have a high probability of occurrence or are unlikely to occur because of the substantial risks to society and nature posed by abrupt changes this report recommends the development of an abrupt change early warning system that would allow for the prediction and possible mitigation of such changes before their societal impacts are severe identifying key vulnerabilities can help guide efforts to increase resiliency and avoid large damages from abrupt change in the climate system or in abrupt impacts of gradual changes in the climate system and facilitate more informed decisions on the proper balance between mitigation and adaptation although there is still much to learn about abrupt climate change and abrupt climate impacts to willfully ignore the threat of abrupt change could lead to more costs loss of life suffering and environmental degradation abrupt impacts of climate change makes the case that the time is here to be serious about the threat of tipping points so as to better anticipate and prepare ourselves for the inevitable surprises

this book is a rebuttal of the common belief that grave environmental consequences are associated with the issues of global warming and nuclear hazards firstly it is argued that after 25 years of research no one has actually found evidence for greenhouse warming instead the heat has caused the evaporation of ocean water to increase cloud coverage reflecting more sunlight away cooling down the earth and nullifying the effects of greenhouse warming the author describes this revolution in climatology through new scientific discoveries that solve the longstanding mystery of the ice ages and explain the enigma of the missing greenhouse heat the solution of the ice age problem is a far most important scientific accomplishment in the second part of the book the author argues that the effects of low level radiation can be beneficial rather than damaging evidence is presented proving that low level radiation in the us from both natural sources and human activities such as nuclear bombs tests actually reduces death rates from cancer and other diseases and increases longevity in the indian state of kerala life span has been shown to increase 10 5 years due to the natural radiation from thorium mines the book proposes that primitive life forms must have developed immune systems to counter the harmful effects of natural radioactivity and that low level radiation from nuclear waste may
