this book is designed to meet the modern need for a better understanding of drug receptor interaction as applied to the gathering and interpretation of dose response data it is an introduction suitable for any student who has had a first course in pharmacology this book is an extension of the pharmacology course into one area of what is now known as molecular pharmacology the material included is an outgrowth of courses that we have given in recent years to health science students in several professional schools and universities the area of drug receptor theory although just a part of molecular phar macology is already very broad one major line of investigation is concerned with the chemical and structural nature of specific receptors and with efforts to isolate specific receptors another line of investigation is concerned with the kinetic theories of drug receptor interaction the effort there being to provide a general theory that is applicable to wide classes of drugs we have chosen to deal with the latter there are several reasons for our choice of topics first the information is very practical that is it permits one to use properly and consistently terms such as efficacy partial agonist pure antagonist potency pa2 etc when describing drug action second many students fail to appreciate the differences in and the limitations of the various theories beginning with the classical theory of a j clark on up to the very recent allosteric theories

nowadays the term dose response is used in many different contexts and many different scientific disciplines including agriculture biochemistry chemistry environmental sciences genetics pharmacology plant sciences toxicology and zoology in the 1940 and 1950s dose response analysis was intimately linked to evaluation of toxicity in terms of binary responses such as immobility and mortality with a limited number of doses of a toxic compound being compared to a control group dose 0 later dose response analysis has been extended to other types of data and to more complex experimental designs moreover estimation of model parameters has undergone a dramatic change from struggling with cumbersome manual operations and transformations with pen and paper to rapid calculations on any laptop advances in statistical software have fueled this development key features provides a practical and comprehensive overview of dose response analysis includes numerous real data examples to illustrate the methodology r code is integrated into the text to give guidance on applying the methods written with minimal mathematics to be suitable for practitioners includes code and datasets on the book s github github com doseresponse this book focuses on estimation and interpretation of entirely parametric nonlinear dose response models using the powerful statistical environment r specifically this book introduces dose response analysis of continuous binomial count multinomial and event time dose response data the statistical models used are partly special cases partly extensions of nonlinear regression models generalized linear and nonlinear regression models and nonlinear mixed effects models for hierarchical dose response data both simple and complex dose response experiments will be analyzed

chief scientist dr antone brooks and his low dose radiation research program team redefined the field applying advances in instrumentation and molecular biology from the human genome project and developing new technologies to examine cellular responses their findings were startling at low doses biological reactions are unique and often unrelated to those that occur at high doses the influential linear no threshold model which predicted that damage from acute exposures can be extrapolated linearly to low dose exposures was flawed small doses of radiation can have an adaptive protective effect hit theory the idea that radiation only affected cells it directly traversed yielded to bystander theory which hypothesizes that cells communicate with each other and a dose to one affects others surrounding it low dose radiation describes the program s development the scientists who made it viable and the fundamental results highlighting lessons learned during its lifespan

this open access book summarizes the latest scientific findings regarding the biological effects of the fukushima daiichi nuclear power plant fnpp accident in 2011 various cases of changes in animals and organisms have been reported since the fnpp accident however it is often unknown whether they are actually due to radiation since the dose or dose rate are not necessarily associated with the changes observed this book brings together the works of radiation biologists and ecologists to provide reliable radioecology data and gives insight into future radioprotection the book examines the environmental pollution and radiation exposure and contains valuable data from abandoned livestock in the ex evacuation zone and from wild animals including invertebrates and vertebrates aqueous and terrestrial animals and plants that are subjected to long term exposure in the area still affected by radiation it also analyzes dose evaluation and offers new perspectives gained from the accident as well as an overview for future studies to promote radioprotection of humans and the ecosystem since the biological impact of radiation is influenced by various factors it is difficult to scientifically define the effects of low dose low dose rate radiation however the detailed research data presented can be combined with the latest scientific and technological advances such as artificial intelligence to provide new insights in the future this book is a unique and valuable resource for researchers professionals and anyone interested in the impact of exposure to radiation or contamination with radioactive materials
