indian summer the succession of warm fair days gracing new england in autumn is at once a flourishing period signaling the end of fall a meteorological event a vernacular cultural construction and a literary metaphor in this appealing and elegant book sweeting plumbs indian summer s use in literature as a symbol of second chance rebirth or reprieve before the onset of a harsher season well researched and charmingly written beneath the second sun is the first book to

systematically treat the history and uses of indian summer imagery in american life the author focuses on the ways in which new englanders have embraced the season and he places the celebration of the season s beauty and its melancholy qualities within the context of anglo native american relations sweeting does not try to locate the original definition of indian summer rather he explores the far more interesting ways in which the season has been imagined and described in american culture popular authors including philip freneau susan cooper lydia sigourney john greenleaf whittier francis parkman oliver wendell holmes and especially henry david thoreau emily dickinson and william dean howells freely employ indian summer imagery in their works in the context of modern american studies sweeting s study is part of a post modern scholarly discussion of how tangible realities such as climate are mediated even forged by social needs sweeting further investigates the imaginative early nineteenth century invention of new england regional identity and integrates traditional american studies literary and historical concerns with a contemporary interest in the environment and sense of place sweeting s graceful lively and accessible style beckons not only scholars of american literature and the nineteenth century but any traveler seeking the

glories of autumn in new england

variability of the indian summer monsoon has increased significantly since the 1950s for several regions across india this means an increase in long dry periods with low or no rainfall intermittent with short intense spells of rainfall these changes are particularly significant for the western central and eastern states of india where more than 55 of the cultivated area is largely rainfed and where the adaptive capacity is the lowest the large scale secular changes in monsoon rainfall are attributed to the increase in global emissions of greenhouse gases and air pollutants at the same time local changes through urbanization land use changes and deforestation have brought in a non uniform response in these rainfall trends changes in the onset duration and intensity of the rainfall call for a reassessment

of the crop calendar and climate resilient measures for the food water energy sectors of the country global warming has also altered the relationship between sea surface temperatures and other predictors of monsoon rainfall introducing increasing challenges and uncertainties in the monsoon forecasts climate projections indicate a further increase in the monsoon variability and a shortening of the rainy season in the future though there is considerable disagreement between model simulations
