**Programming Linguistics** 1990 food or calorie restriction has been shown in many short lived animals and the rhesus monkey to prolong life span life long nutrition studies are not possible in humans because of their long survival studies over two to six years in healthy adult humans have however shown that a 20 reduction in food or calorie intake slows many indices of normal and disease related aging thus it is widely believed that long term reduction in calorie or food intake will delay the onset of age related diseases such as heart disease diabetes and cancer and so prolong life over the last 20 or more years there has been a progressive rise in food intake in many countries of the world accompanied by a rising incidence of obesity thus our increasing food and calorie intake has been linked to the rising incidence of cardiovascular disease and diabetes in early adult life it is accepted that overeating accompanied by reduced physical exercise will lead to more age related diseases and shortening of life span the answer is to reduce our calorie intake improve our diet and exercise more but calorie restriction is extremely difficult to maintain for long periods how then can we solve this problem edited by a team of highly distinguished academics this book provides the latest information on the beneficial effects of calorie restriction on health and life span this book brings us closer to an understanding at the molecular cellular and whole organism level of the way forward

**MANAGEMENT PARADOX: RE-EXAMINED** 2021-01-12 abstract small and informal firms account for a large share of employment in developing countries the rapid expansion of microfinance services is based on the belief that these firms have productive investment opportunities and can enjoy high returns to capital if given the opportunity however measuring the return to capital is complicated by unobserved factors such as entrepreneurial ability and demand shocks which are likely to be correlated with capital stock the authors use a randomized experiment to overcome this problem and to measure the return to capital for the average microenterprise in their sample regardless of whether they apply for credit they accomplish this by providing cash and equipment grants to small firms in sri lanka and measuring the increase in profits arising from this exogenous positive shock to capital stock after controlling for possible spillover effects the authors find the average real return to capital to be 5.7 percent a month substantially higher than the market interest rate they then examine the heterogeneity of treatment effects to explore whether missing credit markets or missing insurance markets are the most likely cause of the high returns returns are found to vary with entrepreneurial ability and with measures of other sources of cash within the household but not to vary with risk aversion or uncertainty
