it is close enough to the end of the century to make a guess as to what the encyclopedia britannica article on the history of mathematics will report in 2582 we have said that the dominating theme of the nineteenth century was the development and application of the theory of functions of one variable at the beginning of the twentieth century mathematicians turned optimistically to the study of functions of several variables but wholly unexpected difficulties were met new phenomena were discovered and new

fields of mathematics sprung up to study and master them as a result except where development of methods from earlier centuries continued there was a recoil from applications most of the best mathematicians of the first two thirds of the century devoted their efforts entirely to pure mathematics in the last third however the powerful methods devised by then for higher dimensional problems were turned onto applications and the tools of applied mathematics were drastically changed by the end of the century the temporary overemphasis on pure mathematics was completely gone and the traditional interconnections between pure mathematics and applications restored this century also saw the first primitive beginnings of the electronic calculator whose development in the next century led to our modern methods of handling mathematics

this volume presents original research contributed to the 3rd annual international conference on computational mathematics and computational geometry cmcgs 2014 organized and administered by global science and technology forum gsf computational mathematics and computational geometry are closely related subjects but are often studied by separate communities and published in different venues this volume is unique in its combination of these topics after the conference which took place in

singapore selected contributions chosen for this volume and peer reviewed the section on computational mathematics contains papers that are concerned with developing new and efficient numerical algorithms for mathematical sciences or scientific computing they also cover analysis of such algorithms to assess accuracy and reliability the parts of this project that are related to computational geometry aim to develop effective and efficient algorithms for geometrical applications such as representation and computation of surfaces other sections in the volume cover pure mathematics and statistics ranging from partial differential equations to matrix analysis finite difference or finite element methods and function approximation this volume will appeal to advanced students and researchers in these areas
