the aim of this book is to bridge the gap between standard textbook models and a range of models where the dynamic structure of the data manifests itself fully the common denominator of such models is stochastic processes the authors show how counting processes martingales and stochastic integrals fit very nicely with censored data beginning with standard analyses such as kaplan meier plots and cox regression the presentation progresses to the additive hazard model and recurrent event data stochastic processes are also used as natural models for individual frailty they allow sensible interpretations of a number of surprising artifacts seen in population data the stochastic process framework is naturally connected to causality the authors show how dynamic path analyses can incorporate many modern causality ideas in a framework that takes the time aspect seriously to make the material accessible to the reader a large number of practical examples mainly from medicine are developed in detail stochastic processes are introduced in an intuitive and non technical manner the book is aimed at investigators who use event history methods and want a better understanding of the statistical concepts it is suitable as a textbook for graduate courses in statistics and biostatistics

the most practical up to date guide to modelling and analyzing time to event data now in a valuable new edition since publication of the first edition nearly a decade ago analyses using time to event methods have increase considerably in all areas of scientific inquiry mainly as a result of model building methods available in modern statistical software packages however there has been minimal coverage in the available literature to 9 guide researchers practitioners and students who wish to apply these methods

to health related areas of study applied survival analysis second edition provides a comprehensive and up to date introduction to regression modeling for time to event data in medical epidemiological biostatistical and other health related research this book places a unique emphasis on the practical and contemporary applications of regression modeling rather than the mathematical theory it offers a clear and accessible presentation of modern modeling techniques supplemented with real world examples and case studies key topics covered include variable selection identification of the scale of continuous covariates the role of interactions in the model assessment of fit and model assumptions regression diagnostics recurrent event models frailty models additive models competing risk models and missing data features of the second edition include expanded coverage of interactions and the covariate adjusted survival functions the use of the worchester heart attack study as the main modeling data set for illustrating discussed concepts and techniques new discussion of variable selection with multivariable fractional polynomials further exploration of time varying covariates complex with examples additional treatment of the exponential weibull and log logistic parametric regression models increased emphasis on interpreting and using results as well as utilizing multiple imputation methods to analyze data with missing values new examples and exercises at the end of each chapter analyses throughout the text are performed using stata version 9 and an accompanying ftp site contains the data sets used in the book applied survival analysis second edition is an ideal book for graduate level courses in biostatistics statistics and epidemiologic methods it also serves as a valuable reference for practitioners and researchers in any health related field or for professionals in insurance and government

low temperature represents together with drought and salt stress one of the most important environmental constraints limiting the pro ductivity and the distribution of plants on the earth winter survival in particular is a highly complex phenomenon with regards to both stress factors and stress responses the danger from winter cold is the result not only of its primary effect i e the formation of ice in plant tissues additional threats are presented by the freezing of water in and on the ground and by the load and duration ofthe snow cover in recent years a number of books and reviews on the subject of chilling and frost resistance in plants have appeared all of these publications however concentrate principally on the mechanisms of injury and resistance to freezing at the cellular or molecular level we are convinced that analysis of the ultrastructural and biochemical alterations in the cell and particularly in the plasma membrane during freezing is the key to understanding the limits of frost resistance and the mechanisms of cold acclimation this is undoubtedly the immediate task facing those of us engaged in resistance research it is nevertheless our opinion that in addition to understanding the basic physiological events we should be careful not to overlook the importance of the comparative aspects of the freezing processes the components of stress avoidance and tolerance and the specific levels of resistance

a powerful new theory of human nature suggests that our secret to success as a species is our unique friendliness brilliant eye opening and absolutely inspiring and a riveting read hare and woods have written the perfect book for our time cass r sunstein author of how change happens and co author of nudge for most of the approximately 300 000 years that homo sapiens have existed we have shared the planet with at least four other types of humans all of these were smart strong and inventive but around 50 000 years ago homo sapiens made a cognitive leap that gave us an edge over other species what happened since charles darwin wrote about evolutionary fitness the idea of fitness has been confused with physical strength tactical brilliance and aggression in fact what made us evolutionarily fit was a remarkable kind of friendliness a virtuosic ability to coordinate and communicate with others that

allowed us to achieve all the cultural and technical marvels in human history advancing what they call the self domestication theory brian hare professor in the department of evolutionary anthropology and the center for cognitive neuroscience at duke university and his wife vanessa woods a research scientist and award winning journalist shed light on the mysterious leap in human cognition that allowed homo sapiens to thrive but this gift for friendliness came at a cost just as a mother bear is most dangerous around her cubs we are at our most dangerous when someone we love is threatened by an outsider the threatening outsider is demoted to sub human fair game for our worst instincts hare s groundbreaking research developed in close coordination with richard wrangham and michael tomasello giants in the field of cognitive evolution reveals that the same traits that make us the most tolerant species on the planet also make us the cruelest survival of the friendliest offers us a new way to look at our cultural as well as cognitive evolution and sends a clear message in order to survive and even to flourish we need to expand our definition of who belongs
