abstract latent class analysis lca is a probabilistic modelling algorithm that allows clustering of data and statistical inference there has been a recent upsurge in the application of lca in the fields of critical care respiratory medicine and beyond in this review we present a brief overview of the principles behind lca

latent class analysis lca is a statistical procedure used to identify qualitatively different subgroups within populations that share certain outward characteristics hagenars mccutcheon 2002 subgroups are referred to as latent groups or classes

latent class growth analysis lcga is a special type of gmm whereby the variance and covariance estimates for the growth factors within each class are assumed to be fixed to zero

## **an introduction to latent class growth analysis and growth**

Nov 03 2023

latent growth modeling approaches such as latent class growth analysis lcga and growth mixture modeling gmm have been increasingly recognized for their usefulness for identifying homogeneous subpopulations within the larger heterogeneous population and for the identification of meaningful groups or classes of individuals

researchers use latent class growth lcg analysis to detect meaningful subpopulations that display different growth curves however especially when the number of classes required to obtain a good fit is large interpretation of the encountered class specific curves might not be straightforward

## ***trajectory modeling with latent groups potentials and pitfalls***

Apr 27 2023

introduction trajectory modeling with latent groups has become increasingly popular to understand patterns of change over time among population subgroups the development of statistical methods to model trajectory groups has come primarily from the fields of criminology psychology and behavioral sciences
