recent years have witnessed a resurgence in the kinetic approach to dynamic many body problems modern kinetic theory offers a unifying theoretical framework within which a great variety of seemingly unrelated systems can be explored in a coherent way kinetic methods are currently being applied in such areas as the dynamics of colloidal suspensions granular material flow electron transport in mesoscopic systems the calculation of lyapunov exponents and other properties of classical many body systems characterised by chaotic behaviour the present work focuses on brownian motion dynamical systems granular flows and quantum kinetic theory

can we prove the necessity of our best physical theories by rational means without appeal to experience this book recounts a few ingenious attempts to derive physical theories by reason only beginning with descartes geometric construction of the world and finishing with recent derivations of quantum mechanics from natural axioms deductions based on theological metaphysical or transcendental arguments are worth remembering for the ways they motivated and structured physical theory even though we would now criticize their excessive confidence in the power of the mind other deductions more modestly relied on criteria for the comprehensibility of nature including forms of measurability causality homogeneity and correspondence the central thesis of this book is that such criteria when properly applied to idealized systems effectively determine some of our most important theories as well as the mathematical character of the laws of physics the relevant arguments are not purely rational because only experience can tell us to which extent nature is comprehensible in a given way nor do they block the possibility of ever more varied forms of comprehensibility they nonetheless suggest the inevitability of much of our theoretical physics
