personal income tax pit is one of the key sources of revenues in advanced economies aes but plays a much more limited role in low income developing countries lidcs and emerging market economies emes both in terms of revenue and redistributive impact notwithstanding this paper shows that lidcs and emes increased their pit to gdp revenue by 110 and 48 percent respectively during the 1990 2019 period a marked improvement in the pit revenue performance we find that this rise was driven primarily by economic developments and to a lesser extent by changes in the design of pit systems we also find that lidcs that improved their tax to gdp ratios relied on a broader set of tax instruments and not exclusively on the pit suggesting that a successful revenue mobilization strategy of developing countries requires a comprehensive approach covering a wider range of taxes finally using a newly assembled dataset of pit characteristics of 157 countries over the 2006 2018 period we estimate a novel redistribution index of the pit in lidcs we show that the contribution of the pit to inequality reductions has been significant

this paper assesses the macroeconomic and distributional impact of personal income tax pit reforms in the u s drawing on a multi sector heterogenous agents model in which consumers have non homothetic preferences and sectors differ in terms of their

relative labor and skill intensity the model is calibrated to key characteristics of the us economy we find that i pit cuts stimulate growth but the supply side effects are never large enough to offset the revenue loss from lower marginal tax rates ii pit cuts do trickle down the income distribution tax cuts stimulate demand for non tradable services which raise the wages and employment prospects of low skilled workers even if the tax cut is not directly incident on them iii a revenue neutral tax plan that reduces pit for middle income groups raises the consumption tax and expands the earned income tax credit can have modestly positive effects on growth while reducing income polarization iv the growth effects from lower income taxes are concentrated in non tradable service sectors although the increased demand for tradable goods generate positive spillovers to other countries v tax cuts targeted to higher income groups have a stronger growth impact than tax cuts for middle income households but significantly worsen income polarization even after taking into account trickle down effects and an expansion of the earned income tax credit

statutory individual income tax rates are the tax rates that apply by law to various amounts of taxable income statutory rates lay the foundation for marginal and average effective tax rates which most economists believe have a greater impact on the economic behavior of companies and individuals than statutory rates marginal effective rates reflect the net effect of special tax provisions on statutory rates they are to be distinguished from average effective rates which measure someone's tax burden current statutory and effective individual tax rates are the result of the tax reform act of 1986 tra86 p 1 99 514 and several tax laws that have been enacted since 1986 of particular importance are the omnibus budget reconciliation act of 1990 obra90 p 1 101 508 the omnibus budget reconciliation act of 1993 obra93 p 1 103 66 the economic growth and tax relief reconciliation act of 2001 egtrra p 1 107 16 the tax relief unemployment insurance reauthorization and job creation act of 2010 truc p 1 111 312 and the american taxpayer relief act of 2012 atra p 1 112 240 tra86 made major changes in the income tax rate structure egtrra established what are referred to as the bush era tax cuts for individuals truc extended those cuts for another two years through 2012 and atra permanently extended the bush era tax rates for taxpayers with taxable incomes below 400 000 for single filers and 450 000 for joint filers but reinstated the 39 6 top rate established by obra93 for taxpayers with taxable incomes equal to or above those amounts there are seven statutory individual income tax rates in 2013 for ordinary income 10 15 25 28 33 35 and 39 6 income from long term capital gains and dividends is taxed at 0 for individuals subject to the 15 tax bracket 15 for individuals subject to the 25 28 33 or 35 brackets and 20 for taxpayers taxed at 39 6 starting in 2013 a 3 8 tax is imposed on the lesser of net investment income received by individuals estates or trusts or the amount of their modified adjusted gross incomes above the threshold amounts of 250 000 for joint filers and 125 000 for single filers in addition the individual alternative minimum tax amt which functions like a separate income tax in that its rate structure is more compressed and tax base wider than those of the regular income tax taxes income above exemption amounts of 80 800 for joint filers and 51 900 for single filers in 2013 at

rates of 26 and 28 tax rates and the income brackets to which they apply are not the only elements of the individual income tax that determine the tax liabilities of taxpayers personal exemptions exclusions deductions credits and certain other elements have an effect as well some of these elements are indexed for inflation congress added annual indexation to the individual income tax in 1981 the primary advantage of such a mechanism is that it helps prevent real tax increases and unintended shifts in the distribution of the tax burden driven by inflation alone indexed elements include tax rate brackets personal exemptions and their phaseout thresholds standard deductions the itemized deduction limitation threshold and the amt exemption amounts this report summarizes the tax brackets and other key elements of the individual income tax that help determine taxpayers marginal and average effective tax rates going back to 1988 it is updated annually to reflect the most recent indexation adjustments and any statutory changes
