engines have pistons that move up and down inside metal tubes called cylinders imagine riding a bicycle your legs move up and down to turn the pedals pistons are connected via rods they re inline the cylinders are arranged in a line in a single bank howstuffworks the core of the engine is the cylinder with the piston moving up and down inside the cylinder single cylinder engines are typical of most lawn mowers but usually cars have more than one cylinder four six and eight cylinders are common when an engine has more than four cylinders they are divided into two cylinder banks three cylinders or more per side the division of cylinders into two banks makes the engine look like a v a v shaped engine with six cylinders v6 engine a v shaped engine with eight cylinders v8 four in each machine built to convert heat from burning gas into the force that turns the road wheels let s take a look at how it works photo car engines turn energy locked in liquid fuel into heat and kinetic energy they re full of pipes and cylinders because they work like mini chemical plants this is the powerful v12 engine on a gloriously restored jaguar xjs sports car from the late 1970s how a car engine works did you know that your car will take in 20 000 cubic feet of air to burn 20 gallons of fuel that s the equivalent of a 2 500 sq ft house if your only experience with a car engine s inner
