the cartographic products required to support science and planetary exploration during the next 10 years were assessed only major map series or first order maps needed to characterize the surface physiography of a planet or satellite were considered included in these considerations are maps needed as bases for plotting geologic geophysical and atmospheric phenomena and for planning future planetary exploration these products consist of three types of maps controlled photomosaics shaded relief maps and topographic contour maps

dictionary of minor planet names fifth edition is the official reference for the field of the iau which serves as the internationally recognised authority for assigning designations to celestial bodies and any surface features on them the accelerating rate of the discovery of minor planets has not only made a new edition of this established compendium necessary but has also significantly altered its scope this thoroughly revised edition concentrates on the approximately 10 000 minor planets that carry a name it provides authoritative information about the basis for all names of minor planets in addition to being of practical value for identification purposes this collection provides a most interesting historical insight into the work of those astronomers who over two centuries vested their affinities in a rich and colorful variety of ingenious names from heavenly goddesses to more prosaic constructions the fifth edition serves as the primary reference with plans for complementary booklets with newly named bodies to be issued every three years

since the discovery of the first exoplanet orbiting a main sequence star in 1995 nearly 500 planets have been detected with this number expected to increase dramatically as new ground based planetary searches begin to report their results emerging techniques offer the tantalizing possibility of detecting an earth mass planet in the habitable zone of a solar type star as well as the exciting prospect of studying exoplanetary atmospheres that could reveal the presence of biomarkers such as water vapor oxygen and carbon dioxide can we find the holy grail of exoplanets cutting edge research may reveal the answer written by internationally renowned scientists at the forefront of the field extra solar planets the detection formation evolution and dynamics of planetary systems presents powerful analytical tools and methods for investigating extra solar planetary systems it discusses new theories on planetary migration and resonant capture that elucidate the existence of hot jupiters it also examines the astrophysical mechanisms required to assemble gas giant planets close to their parent star in addition the expert contributors describe how mathematical tools involving periodicity chaos and resonance are used to study the diversity and stability of observed planetary systems by presenting the fundamental analyses that underpin modern studies of extra solar planetary systems this graduate level book enables readers to thoroughly understand important recent developments and offers a platform for future research it also improves readers understanding of our own

solar system and its place in the diverse range of planetary systems discovered so far

this book approaches geological geomorphological and topographical mapping from the point in the workflow at which science ready datasets are available though there have been many individual projects on dynamic maps and online giss in which coding and data processing are given precedence over cartographic principles cartography is more than just processing and displaying spatial data however there are currently no textbooks on this rapidly changing field and methods tend to be shared informally addressing this gap in the literature the respective chapters outline many topics pertaining to cartography and mapping such as the role and definition of planetary cartography and vs geographic information science theoretical background and practical methodologies in geological mapping science ready versus public ready products a goal procedure focused practical manual of the most commonly used software in planetary mapping which includes generic arcgis and its extensions jmars and specific tools hiview cratertools etc extracting topographic information from images thematic mapping climate geophysics surface modeling change detection landing site selection shared maps dynamic maps on the web planetary gis interfaces crowdsourcing crater counting techniques irregular bodies geological unit symbology mapping center activities and web services all chapters were prepared by authors who have actually produced

geological maps or giss for nasa the usgs dlr esa or miigaik taken together they offer an excellent resource for all planetary scientists whose research depends on mapping and for students of astrogeology

recent years have been tough on optimists hopes that the internet might bring people together have been crushed by the ills of social media is there a way back chris anderson the head of ted believes that we can turn outrage back into optimism it all comes down to reimagining one of the most fundamental human virtues generosity what if generosity could become infectious generosity consider how a london barber began offering haircuts to people experiencing homelessness and catalysed a movement how two anonymous donors gave 10 000 each to 200 strangers and discovered that most recipients wanted to pay it forward with their own generous acts how ted itself transformed from a niche annual summit into a global beacon of ideas by giving away talks online allowing millions access to free learning in telling these inspiring stories anderson offers a playbook for how to embark on our own generous acts whether gifts of money time talent connection or kindness and to prime them thanks to the internet to have self replicating world changing impacts

dynamic mars recent and current landscape evolution of the red planet presents the latest observations interpretations and explanations of geological change at the surface or near surface of this terrestrial body these changes raise questions about a decades old paradigm formed largely in the aftermath of very coarse mariner mission imagery in the 1960s suggesting that much of the interesting geological activity on mars occurred deep in its past eons ago the book includes discussions of 1 mars ever changing atmosphere and the impact of this on the planet's surface and near surface 2 the possible involvement of water in relatively new if not contemporary gully like flows and slope streaks i e recurring slope lineae and 3 the identification of a broad suite of agents and processes i e glacial periglacial aeolian meteorological volcanic and meteoric that are actively revising surface and near surface landscapes landforms and features on a local regional and hemispheric scale highly illustrated and punctuated by data from the most recent mars missions dynamic mars is a valuable resource for all levels of research in the geological history of mars as well as of the three other terrestrial planets utilizes observational and model based data as well as geological context to frame the understanding of the dynamic surface and near surface of mars presents a broad spectrum of highly regarded experts and themes to discuss and evaluate the geological history of late and current mars includes extensive and detailed imagery to clearly illustrate these themes discussions and evaluations
