the unique feature of this compact student s introduction is that it presents concepts in an order that closely follows a standard mathematics curriculum rather than structure the book along features of the software as a result the book provides a brief introduction to those aspects of the mathematica software program most useful to students the second edition of this well loved book is completely rewritten for mathematica 6 including coverage of the new dynamic interface elements several hundred exercises and a new chapter on programming this book can be used in a variety of courses from precalculus to linear algebra used as a supplementary text it will aid in bridging the gap between the mathematics in the course and mathematica in addition to its course use this book will serve as an excellent tutorial for those wishing to learn mathematica and brush up on their mathematics at the same time

cottam and tilley provide an introduction to the properties of wave like excitations associated with surfaces and interfaces the emphasis is on acoustic optic and magnetic excitations and apart from one section on liquid surfaces the text concentrates on solids the important topic of superlattices is also discussed in which the different kinds of excitation are considered from a unified point of view throughout the book the authors are careful to relate theory and experiment and all of the most important experimental techniques are described the theoretical treatment assumes only a knowledge of undergraduate physics except for green function methods that are used in a few sections these methods are developed in an appendix the book also contains extensive references enabling the reader to consult the research and review literature each of the main chapters contains problems to allow the reader to develop topics presented in the text

like a pianist who practices from a book of tudes readers of programming projects in c for students of engineering science and mathematics will learn by doing written as a tutorial on how to think about organize and implement programs in scientific computing this book achieves its goal through an eclectic and wide ranging collection of projects each project presents a problem and an algorithm

for solving it the reader is guided through implementing the algorithm in c and compiling and testing the results it is not necessary to carry out the projects in sequential order the projects contain suggested algorithms and partially completed programs for implementing them to enable the reader to exercise and develop skills in scientific computing require only a working knowledge of undergraduate multivariable calculus differential equations and linear algebra and are written in platform independent standard c and the unix command line is used to illustrate compilation and execution the primary audience of this book is graduate students in mathematics engineering and the sciences the book will also be of interest to advanced undergraduates and working professionals who wish to exercise and hone their skills in programming mathematical algorithms in c a working knowledge of the c programming language is assumed

this book provides exposition of the subject both in its general and algebraic aspects it deals with the notions of topological spaces compactness connectedness completeness including metrizability and compactification algebraic aspects of topological spaces through homotopy groups and homology groups it begins with the basic notions of topological spaces but soon going beyond them reaches the domain of algebra through the notions of homotopy homology and cohomology how these approaches work in harmony is the subject matter of this book
