- 1 integers
- 2 are all the positive whole numbers all the negative whole numbers and zero in the following exercises evaluate

- 35 a when  $a = 4$
- 2r when  $r = 3$
- $3m - 2n$  when  $m = 6$
- $n - 8$
- y when  $y = 17$

in the following exercises translate each phrase into an algebraic expression and then simplify if possible

- the difference of 7 and 4
- the quotient of 25 and the sum of m and n

consecutive integers are integers that follow in sequence each number being 1 more than the previous number represented by  $n, n + 1, n + 2, n + 3$  where n is any integer for example 23 24 25 if we start with an even number and each number in the sequence is 2 more than the previous number then we will get consecutive even integers but within the parentheses you still need to follow pemdas first we will solve the exponent and the square of 2 is 4 then we ll divide 16 by 4 which gives us 4 so we can rewrite our original equation as we can now divide into which gives us there are ten

10 practice questions below about dividing integers keep practicing until you master the skill good luck for your convenience i included a summary on how to divide integers the main idea is that if you divide two integers with the same sign the answer is positive solvers with work shown write algebra lessons help you solve your homework problems interactive solvers for algebra word problems ask questions on our question board algebra calculator get free step by step solutions for your algebra math problems subscribe to verify your answer subscribe

- two step integers
- two step add
- step 1 divide their absolute values
- step 2 determine the sign of the final answer known as a quotient using the following conditions

- condition 1 if the signs of the two numbers are the same the quotient is always a positive number
- condition 2 if the signs of the two

numbers are different the quotient is always a negative number what is a  
 logarithm logarithms can have decimals working with exponents and logarithms  
 polynomials what is a polynomial the whole numbers and their opposites are  
 called the integers the we will look at zero and negative exponents in a bit let s  
 first recall the definition of exponentiation with positive integer exponents if a a is  
 any number and n n is a positive integer then an a a a a n times a n a a a a n  
 times so for example  $3^5 = 3 \cdot 3 \cdot 3 \cdot 3 \cdot 3 = 243$   $3^{-5} = \frac{1}{3^5} = \frac{1}{243}$
