demography in archaeology first published in 2006 is a review of current theory and method in the reconstruction of populations from archaeological data starting with a summary of demographic concepts and methods the book examines historical and ethnographic sources of demographic evidence before addressing the methods by which reliable demographic estimates can be made from skeletal remains settlement evidence and modern and ancient biomolecules recent debates in palaeodemography are evaluated new statistical methods for palaeodemographic reconstruction are explained and the notion that past demographic structures and processes were substantially different from those pertaining today is critiqued the book covers a wide span of evidence from the evolutionary background of human demography to the influence of natural and human induced catastrophes on population growth and survival this is essential reading for any archaeologist or anthropologist with an interest in relating the results of field and laboratory studies to broader questions of population structure and dynamics this book is an encyclopedic treatment of shell analysis with material suitable for students and professional archaeologists and paleontologists it covers the history of archaeological interest in shells the biology of freshwater and marine mollusks and critically discusses current techniques methods and research problems what can shells tell us about the environmental characteristics and ancient habitats or about the people who collected them these and other fascinating questions are raised in this authoritative accessible text

fieldwork in archaeology has been transformed over the past three decades drawing on a wealth of experience in excavating some of the most complex deeply stratified sites in britain steve roskams describes the changes that have taken place in the theory and practice of excavation he then provides a clear account of contemporary techniques covering pre excavation reconnaissance and site evaluation the preparations for full excavation the actual process of excavation and the recording of photographic spatial stratigraphic and physical evidence a final chapter discusses the future of excavation this manual will be welcomed by the professional excavator the academic researcher students and the interested amateur this volume originally published in 1989 is intended as a practical guide to archaeological illustration from drawing finds in the field to technical studio drawing for publication it is also an invaluable reference tool for the interpretation of illustrations and their status as archaeological evidence the book s ten chapters start from first principles and guide the illustrator through the historical development of archaeological illustration and basic skills each chapter then deals with a different illustrative technique drawing in the field during survey work and excavation drawing artefacts buildings and reconstructions producing artwork for publication and the early uses of computer graphics information about appropriate equipment as well as a guide to manufacturers is also supplied an obvious and important feature of archaeological illustration is the 120 line drawings and half tones which show the right and the wrong way of producing drawings this volume will therefore be of interest to amateur and professional archaeologists alike conservation treatments and techniques for the archaeologist in the field emphasizing how to conserve an excavated object before it is taken to a trained conservator offsite safety procedures and conservation supplies and materials are recommended techniques for lifting cleaning consolidating marking and storing are discussed along with methods for treating specific artifact materials e g amber wood appendixes cover impressions and chemical preparations the first overview of sampling for archaeologists for over twenty

years this manual offers a comprehensive account of the applications of statistical sampling theory which are essential to modern archaeological practice at a range of scales from the regional to the microscopic bringing archaeologists up to date with an aspect of their work which is often misunderstood it includes a discussion of the relevance of sampling theory to archaeological interpretation and considers its fundamental place in fieldwork and post excavation study it demonstrates the vast range of techniques that are available only some of which are widely used by archaeologists a section on statistical theory also reviews latest developments in the field and the formal mathematics is available in an appendix cross referenced with the main text this is an up to date account of the different kinds of information that can be obtained through the archaeological study of pottery fishes is a practical introduction to the study of fish remains from archaeological sites designed for archaeologists and archaeozoologists working in the field and in the laboratory it provides clear guidelines for the identification of remains and how to interpret them the identification and analysis of fish remains unearthed in archaeological excavations are invaluable factors in the reconstruction of climate economic strategy diet and trade in this manual the authors discuss the importance of fishes in past economies and in archaeological research they describe methods of extraction fish anatomy and classification with the aid of numerous line drawings the book also includes a survey of fishes most likely to be represented in archaeological sites and describes the biology of fishes in order to help archaeozoologists make informed judgements about methods of exploitation size of fish caught and meat yield this study is unique in making a realistic assessment of both the potential and limitations of the use of fish remains in archaeological interpretation many archaeologists as primarily social scientists do not have a background in the natural sciences this can pose a problem because they need to obtain chemical and physical analyses on samples to perform their research this manual is an essential source of information for those students without a background in science but also a comprehensive overview that those with some understanding of archaeological science will find useful the manual provides readers with the knowledge to use archaeological science methods to the best advantage it describes and explains the analytical techniques in a manner that the average archaeologist can understand and outlines clearly the requirements benefits and limitations of each possible method of analysis so that the researcher can make informed choices the work includes specific information about a variety of dating techniques provenance studies isotope analysis as well as the analysis of organic lipid and protein residues and ancient dna case studies illustrating applications of these approaches to most types of archaeological materials are presented and the instruments used to perform the analyses are described available destructive and non destructive approaches are presented to help archaeologists select the most effective technique for gaining the target information from the sample readers will reach for this manual whenever they need to decide how to best analyze a sample and how the analysis is performed this is a foreword by an archaeologist not a conservator but as brad rodgers says conservation has been steadily pulled from archaeology by the forces of specialization p 3 and hewantstoremedy that situation through this manual he sees this work as a call to action for the non professional conservator permitting curators conservators and archaeologists to identify artifacts that need professional attention and allow these professionals to stabilize most artifacts in their own laboratories with minimal intervention using simple non toxic procedures p 5 it is the mission of brad s manual to bring conservation back into archaeology p 6 the degree of success of that goal depends on the degree to which archaeologists pay attention to and put to use what brad has to say because as he says the conservationist archaeologist is responsible to make preparation for an artifact s care even before it is excavated and after its storage into the foreseeable future a tremendous responsibility p 10 the manual is a combination of highly technical as well as common sense methods of conserving wood iron and other metals ceramics glass and stone organics and composites

A Consumer's Guide to Archaeological Science

this is a foreword by an archaeologist not a conservator but as brad rodgers says conservation has been steadily pulled from archaeology by the forces of specialization p 3 and he wants to remedy that situation through this manual he sees this work as a call to action for the non professional conservator permitting curators conservators and archaeologists to identify artifacts that need professional attention and allow these professionals to stabilize most artifacts in their own laboratories with minimal intervention using simple non toxic procedures p 5 it is the mission of brad s manual to bring conservation back into archaeology p 6 the degree of success of that goal depends on the degree to which archaeologists pay attention to and put to use what brad has to say because as he says the conservationist archaeologist is responsible to make preparation for an artifact s care even before it

is excavated and after its storage into the foreseeable future a tremendous responsibility p 10 the manual is a combination of highly technical as well as common sense methods of conserving wood iron and other metals ceramics glass and stone organics and composites a far better guide to artifact conservation than was available to me when i first faced that archaeological challenge at colonial brunswick town north carolina in 1958 a challenge still being faced by archaeologists today the stage of conservation in 1958 is in dramatic contrast to the procedures brad describes in this manual conservation has indeed made great progress for instance a common procedure then was to heat the artifacts red hot in a furnace a method that made me cringe
