Automotive Fuels. Diesel. Requirements and Test Methods 1913-09-30 tests were done to examine the feasibility of disposing of used engine oil from military vehicles by blending it with jp 8 engine fuel to be used in diesel vehicles two army diesel engines were evaluated in cyclic endurance dynamometer test procedures using jp 8 fuel blended with 7 5 vol used oil results were compared to baseline performance using neat jp 8

fuel the following major differences were observed when using blended fuel significant ashy deposits were found in the pre combustion chamber of the 4 cycle diesel engine indications of imminent exhaust valve burning streaking were found on the exhaust valves in the 2 cycle diesel engine for both engines condition was such that continuous use of 7 5 vol blend would not be recommended considering it would take between 19 68 years for an army engine to reach the end of endurance test condition use of blended fuel 1 or 2 times per year is judged acceptable from an endurance standpoint

Diesel Engine Endurance Tests Using JP-8 Fuel

Blended With Used Engine Oil 1998 an engine test technique was developed for evaluating the performance of sub zero engine oils in high output diesel engines field tested lubricants were used to develop the laboratory engine performance criteria validity of the test procedure is demonstrated by direct laboratory to field correlation the major areas of test technique development establishment of performance criteria lubricant evaluations and overall lubricant performance are presented and discussed as an integrated effort rather than each as a separate project phase illustrations of hardware including test set up and test components are included for summary purposes only physical and compositional properties of the test development lubricant are discussed which help explain why the engine discriminates lubricant quality under high output conditions the test method developed as a result of this work could be used to qualify military arctic engine oil candidates author
