rational expressions bring together what we know from fractions with our polynomial skills they arise in a variety of contexts involving rates particularly when there are unknowns or changing values in the denominator we'll model with basic rational expressions then use the polynomial properties to extend our fraction operations

rational expressions an expression that is the ratio of two polynomials it is just like a fraction but with polynomials other examples also but not in general a rational function is the ratio of two polynomials $p(x)$ and $q(x)$ like this $f(x) = \frac{p(x)}{q(x)}$ except that $q(x)$ cannot be zero and anywhere that $q(x) = 0$ is undefined

rational expressions in arithmetic it is noted that a fraction is a quotient of two whole numbers the expression $\frac{a}{b}$ where a and b are any two whole numbers and $b \neq 0$ is called a fraction the top number a is called the numerator and the bottom number b is called the denominator simple algebraic fraction
