how the objective of a resource efficient low carbon economy is to be reached and how the transition is managed are the key issues addressed by this publication the two main focuses are industrial policy and employment prospects on the road to a green economy that retains its industrial base any lasting recovery of the real economy will necessarily take the shape of a more resource efficient production model while we argue that only a more ambitious and comprehensive european climate policy framework would have a chance of delivering the broader 2050 climate targets this does not mean that europe has to give up its industrial base and its related competences several chapters of this book argue that the option of attaining a low carbon economy through deindustrialisation would prevent europe from preserving its competitiveness and knowledge base which are also essential for exploiting the potential of the emerging eco industry while decoupling economic growth from resource use is also possible with an industrial base that is more energy and resource efficient this does require a fundamental shift in terms of how the economy is managed and how business decisions are made sustainable industrial and structural policies are needed also in order to ensure that

this revolutionary process takes place in a socially balanced manner

this book is a pedagogical introduction to supergravity a gravitational field theory that includes supersymmetry symmetry between bosons and fermions and is a generalization of einstein s general relativity supergravity provides a low energy effective theory of superstring theory which has attracted much attention as a candidate for the unified theory of fundamental particles and it is a useful tool for studying non perturbative properties of superstring theory such as d branes and string duality this work considers classical supergravities in four and higher spacetime dimensions with their applications to superstring theory in mind more concretely it discusses classical lagrangians or field equations and symmetry properties of supergravities besides local symmetries supergravities often have global non compact symmetries which play a crucial role in their applications to superstring theory one of the main features of this book is its detailed discussion of these non compact symmetries the aim of the book is twofold one is to explain the basic ideas of supergravity to those who are not familiar with it toward that end the discussions are made both pedagogical and concrete by stating equations explicitly the other is to collect relevant formulae in one place so as to be

useful for applications to string theory the subjects discussed in this book include the vielbein formulation of gravity supergravities in four dimensions possible types of spinors in various dimensions superalgebras and supermultiplets non linear sigma models for non compact lie groups electric magnetic duality symmetries supergravities in higher dimensions dimensional reductions and gauged and massive supergravities
