issues of gender religion and landscape in the works of shakespeare and spenser are examined through the lens of colonialism and national identity in this literary critical analysis this period in early modern english literature is

marked by a redefinition of what it means to be british and close readings of the texts reveal spenser s developing and ambivalent sense of irishness and shakespeare s alleged catholic recusancy the relationship between biographical details and imaginative writing reveal the conflicting issues of literary reputation and identity that make discussions of nationalism so complex pastoralism versus ruralism and internal insurrection versus foreign invasion are among the themes discussed

in contours of white ethnicity yiorgos anagnostou explores the construction of ethnic history and reveals how and why white ethnics selectively retain rework or reject their pasts challenging the tendency to portray americans of european background as a uniform cultural category the author demonstrates how a generalized view of american white ethnics misses the specific identity issues of particular groups as well as their internal differences interdisciplinary in scope contours of white ethnicity uses the example of greek america to illustrate how the immigrant past can be used to combat racism and be used to bring about solidarity between white ethnics and racial minorities illuminating the importance of the past in the construction of ethnic identities today anagnostou presents the politics of evoking the past to create community affirm identity and nourish reconnection with ancestral roots then identifies the struggles to neutralize oppressive pasts although it draws from the scholarship on a specific ethnic group contours of white ethnicity exhibits a sophisticated interdisciplinary methodology which makes it of particular interest to scholars researching ethnicity and race in the united states and for those charting the directions of future research for white ethnicities

nuclear power plants emit radiation and particles across a range of energies this radiation can cause corrosion to occur in critically important parts of the plant which can lead to efficiency and safety problems gamma rays and neutrons have the highest energies and can break the metal bonds in interior metallic structures causing damage quickly and in easily monitored ways consequently these types of radiation and the best alloys to use to mitigate their effects have been extensively researched and their findings applied however the same is not true of low energy radiation which effects metal structures in a different way but can still cause appreciable and expensive corrosion low energy radiation degrades the passive oxide layers that protect metals without this protective layer the metals are easily corroded this book uses tritium and tritiated water as models to describe the effects of low energy radiation on the corrosion of metals in these environments comprehensive coverage of the fields of liquid and gas flow heat exchange gas diffusion in materials and of materials resistance to corrosion is ensures the reader has a full understanding of how these processes effect corrosion in nuclear installations such an understanding is essential for the efficient and safe running of all modern plant that uses radioactive material and this book is a critical reference tool for anyone involved in the nuclear power industry or metals research unique coverage of low energy radiation and its corrosive effects in nuclear installations provides coverage of basic scientific principles contributing to corrosion an essential reference for the safe and efficient construction and operation of nuclear installations applications in power generation fuel reprocessing military and civilian applications the first book to present detailed analysis of nuclear corrosion by low energy nuclides the most complete book available for those serious about understanding corrosion in all its aspects keeping you at pace with the new methods that are changing the concept of corrosion in the nuclear industry

can reason and religion get together should believers think can thinking people believe does religion have to make sense does careful thinking help or hinder religious experience people have wrestled with such questions for hundreds of years and they are just as perplexing today as ever reason the contours of faith explores the wide ranging issues these questions raise from biblical interpretation and proofs for god s existence to the nature of religious conversion its central purpose is to find an alternative to both fideism the idea that reason has nothing to do with faith and rationalism the conviction that reason has everything to do with it part one reason and the contents of faith argues that reason contributes in important but limited ways to our understanding of religion part two reason and the experience of faith shows that reason can support religious commitment but never produces it

many approaches have been proposed to solve the problem of finding the optic flow field of an image sequence three major classes of optic flow computation techniques can discriminated see for a good overview beauchemin and barron ibeauchemin19951 gradient based or differential methods phase based or frequency domain methods correlation based or area methods feature point or sparse data tracking methods in this chapter we compute the optic flow as a dense optic flow field with a multi scale differential method the method originally proposed by florack and nielsen florack1998a is known as the multiscale optic flow constrain equation mofce this is a scale space version of the well known computer vision implementation of the optic flow constraint equation as originally proposed by horn and schunck horn1981 this scale space variation as usual consists of the introduction of the aperture of the observation in the process the application to stereo has been described by maas et al maas 1995a maas 1996a of course difficulties arise when structure emerges or disappears such as with occlusion cloud formation etc then knowledge is needed about the processes and objects involved in this chapter we focus on the scale space approach to the local measurement of optic flow as we may expect the visual front end to do 17 2 motion detection with pairs of receptive fields as a biologically motivated start we begin with discussing some neurophysiological findings in the visual system with respect to motion detection

in art and representation john willats presents a radically new theory of pictures to do this he has developed a precise vocabulary for describing the representational systems in pictures the ways in which artists engineers photographers mapmakers and children represent objects his approach is derived from recent research in visual perception and artificial intelligence and willats begins by clarifying the key distinction between the marks in a picture and the features of the scene that these marks represent the methods he uses are thus closer to those of a modern structural linguist or psycholinguist than to those of an art historian using over 150 illustrations willats analyzes the representational systems in pictures by artists from a wide variety of periods and cultures he then relates these systems to the mental processes of picture production and displaying an impressive grasp of more than one scholarly discipline shows how the greek vase painters chinese painters giotto icon painters picasso paul klee and david hockney have put these systems to work but this book is not only about what systems artists use but also about why artists from different periods and cultures have used such different systems and why drawings by young children look so different from those by adults willats argues that the representational systems can serve many different functions beyond that of merely providing a convincing illusion these include the use of anomalous pictorial devices such as inverted perspective which may be used for expressive reasons or to distance the viewer from the depicted scene by drawing attention to the picture as a painted surface willats concludes that art historical changes and the developmental changes in children s drawings are not merely arbitrary nor are they driven by evolutionary forces rather they are determined by the different functions that the representational systems in pictures can serve like readers of ernst gombrich s famous art and illusion still available from princeton university press on which art and representation makes important theoretical advances or rudolf arnheim s art and visual perception willats s readers will find that they will never again return to their old ways of looking at pictures

abstract biological vision is a rather fascinating domain of research scientists of various origins like biology medicine neurophysiology engineering math ematics etc aim to understand the processes leading to visual perception process and at reproducing such systems understanding the environment is most of the time done through visual perception which appears to be one of the most fundamental sensory abilities in humans and therefore a significant amount of research effort has been dedicated towards modelling and repro ducing human visual abilities mathematical methods play a central role in this endeavour introduction david marr s theory v as a pioneering step tov ards understanding visual percep tion in his view human vision was based on a complete surface reconstruction of the environment that was then used to address visual subtasks this approach was proven to be insufficient by neuro biologists and complementary ideas from statistical pattern recognition and artificial intelligence were introduced to bet ter address the visual perception problem in this framework visual perception is represented by a set of actions and rules connecting these actions the emerg ing concept of active vision consists of a selective visual perception paradigm that is basically equivalent to recovering from the environment the minimal piece information required to address a particular task of interest
