the class is turned into insects to learn about them

Insect Invaders

2001

describes the life cycle of ladybugs from egg through larva and pupa to adult and explains how ladybugs aid humans by feeding on insect pests

Ladybugs

1983

much of our understanding about insect predator prey dynamics has been due to studies on insect parasitoids but do true predators such as ladybird beetles really operate in a similar way and how does this affect their use in biological control the extensive literature on ladybirds as biocontrol agents shows that their size and rate of development is very dependent on the nature of their prey this volume explores basic ladybird biology their association with their prey and its effect on development rate and body size optimal foraging theory field observations and laboratory experiments are used to illustrate how ladybird larvae maximise their rate of energy intake and ladybird adults their fitness the interdependence of these life history parameters is then used to develop a simple predator prey model which with an analysis of the literature highlights the specific attributes of potentially successful biocontrol agents for all those interested in predator prey dynamics

Ladybugs

2011-01-01

this revised and updated edition of ladybirds provides a succinct but comprehensive and accessible overview of the biology of ladybirds and their parasites focusing on ecology in an evolutionary context
