Extreme Programming Explained *2004-11-17*

this short book provides basic information about bioinstrumentation and electric circuit theory many biomedical instruments use a transducer or sensor to convert a signal created by the body into an electric signal our goal here is to develop expertise in electric circuit theory applied to bioinstrumentation we begin with a description of variables used in circuit theory charge current voltage power and energy next kirchhoff s current and voltage laws are introduced followed by resistance simplifications of resistive circuits and voltage and current calculations circuit analysis techniques are then presented followed by inductance and capacitance and solutions of circuits using the differential equation method finally the operational amplifier and time varying signals are introduced this lecture is written for a student or researcher or engineer who has completed the first two years of an engineering program i e 3 semesters of calculus and differential equations a considerable effort has been made to develop the theory in a logical manner developing special mathematical skills as needed at the end of the short book is a wide selection of problems ranging from simple to complex

it is a silent invisible and deadly weapons system it can paralyze an entire nation without a single soldier being sent to war we glimpsed its potential on television when surgical strikes on radar sites electrical power plants and command networks crippled iraqi forces during the gulf war now in the next world war james adams shows how a new chapter in military history is being written as the information age comes to the battlefield to bigger and stronger now add smarter as increasingly sophisticated computers and microtechnology have become available the concept of conventional warfare has changed technology has already made its way to the front lines soldiers are now equipped for example with new smart technologies such as handheld computers that allow them to e mail their commanders there are devices that can sense an enemy s presence before the enemy is visible by detecting body heat or by communication with satellites overhead robotic bugs can even be sent in swarms to sabotage weapons or subdue enemy soldiers but the most significant and important use of information warfare won t be on the battlefield the most devastating weapons will be those that target an enemy s infrastructure air control systems electrical grids and communication networks to name just a few potential targets trojan horse chips or viruses designed to accept and respond to commands from u s military intelligence can be installed in computers being sold overseas making them vulnerable to attack by hacking into computer systems the united states could override programmed commands and thus shut down air traffic control systems and open floodgates and bridges misinformation could even be broadcast for example by using imaging technology to simulate a television appearance by an enemy nation s leaders this type of combat puts civilians at more risk than ever as financial communication transportation and other infrastructure systems become prime military targets and information warfare puts the united states a nation increasingly dependent on technology in a position of both definite advantage and extreme vulnerability in the next world war james adams draws on impressive research as well as his lifetime of reporting on intelligence and military affairs to give us a chilling scenario of how wars will be fought in the new millennium and how much closer to home they might strike

Computer Virus Prevalence Survey, (1996) *1998*

a definitive reference about the year 2000 software crisis this title contains contributions from the world s leading experts on the problem it professionals will learn how to get started solving the problem how to make choices in selecting outside consulting help how to draw up action plans and how to get the problem solved before the infamous date arrives
