by the second half of the twentieth century a new branch of materials science had come into being crystalline materials research its appearance is linked to the emergence of advanced technologies primarily based on single crystals bulk crystals and films at the turn of the last century the impending onset of the ceramic era was forecasted it was believed that ceramics would play a role comparable to that of the stone or bronze ages in the history of civilization naturally such an assumption was hypothetical but it showed that ceramic materials had evoked keen interest among researchers although sapphire traditionally has been considered a gem it has developed into a material typical of the ceramic era widening the field of sapphire application necessitated essential improvement of its homogeneity and working characteristics and extension of the range of sapphire products especially those with stipulated properties including a preset structural defect distribution in the early 1980s successful attainment of crystals with predetermined characteristics was attributed to proper choice of the growth method at present in view of the fact that the requirements for crystalline products have become more stringent such an approach tends to be insufficient it is clear that one must take into account the physical chemical processes that take place during the formation of the real crystal structure i.e. the growth mechanisms and the nature and causes of crystal imperfections

nobody can know everything for the successful application of techniques based on nuclear magnetic resonance to clinical problems it is a vital necessity that individuals with widely different skills should learn a little of each others trades by co operation and communication ernest cady has long proved himself a master of these arts to his colleagues at university college london and by writing this excellent book he extends his experience to a wide circle of readers although the nuclear magnetic resonance nmr phenomenon had been predicted theoretically and to some degree demonstrated experimentally appreciably earlier it required the advances in electronics that took place during world war ii to turn nmr into a practical technique as demonstrated independently in 1946 by bloch and purcell since then nmr has been used extensively and increasingly by chemists and physicists in the 1970s the first applications of nmr to animal organs yielded important advances in our knowledge of the biochemical and physiological processes as they occur in genuinely intact tissues they showed incidentally that some conventional techniques introduce significant artifacts
