in recent years autonomous robots including xavier martha 1 rhino 2 3 minerva and remote agent have shown impressive performance in long term demonstrations in nasa s deep space program for example an tonomous spacecraft controller called the remote agent 5 has autonomously performed a scienti c experiment in space at carnegie mellon university xavier 6 another autonomous mobile robot navigated through an o ce vironment for more than a year allowing people to issue navigation commands and monitor their execution via the internet in 1998 minerva 7 acted for 13 days as a museum tourguide in the smithsonian museum and led several thousand people through an exhibition these autonomous robots have in common that they rely on plan based c trol in order to achieve better problem solving competence in the plan based approach robots generate control actions by maintaining and executing a plan that is e ective and has a high expected utility with respect to the robots c rent goals and beliefs plans are robot control programs that a robot can not only execute but also reason about and manipulate 4 thus a plan based c troller is able to manage and adapt the robot s intended course of action the plan while executing it and can thereby better achieve complex and changing tasks

when executing a plan the traditional assumption of complete certainty is rarely valid in real world situations actions may fail to complete or may take much longer than initially anticipated because of this layers of robustness are required that allow flexibility during execution there are two aspects of an executive that need addressing to provide the ability to deal with uncertainties monitoring and control this thesis examines both of these aspects and shows how these may be used during execution for monitoring the use of hidden markov models is proposed tracing the execution of a task through a model allows the executive to detect its current state even when this is

not directly observable from within the system the trajectory of states through the model can reveal execution irregularities which can be flagged and identified as failure this work explores the use of learnt models evaluating their performance in various contexts for control the use of opportunistic plans is examined these can be used after failure has occurred or when an action successfully finishes early the definition of opportunistic plans is expanded to include extra structures that may be of use during the creation of these execution issues surrounding opportunistic plans are addressed including how to decide when to execute an opportunity the logical requirements for this are discussed and several opportunity insertion strategies are developed this is followed by a technique for deciding if resources should be conserved for later opportunities with the prospect of greater reward
