by the end of the twentieth century there were some half million tractors on british farms more machines than people to drive them brian bell's encyclopaedic book traces the evolution of the farm tractor from the days of starting handle and pan seat to current 4 wheel drive machines with air conditioned cabs and computer management systems he deals in particular with developments of the classic period from the 1950s to the 1990s the book is arranged alphabetically by manufacturer from allis chalmers to zetor one hundred marques in total these are all machines to be found on british farms irrespective of their country of manufacture brian runs concisely through the histories of the companies and their major models illustrated with a wealth of photographs and extracts from sales literature he adds some special features on items such as hydraulic systems and cold starting aids he includes a glossary and full index this book replaces the author's earlier successful fifty years of farm tractors many of the photographs are new and the text has been brought up to date to include developments of the early twenty first century in nigeria despite the scarcity of tractors average horsepower and prices of tractors appear high these patterns are different from the experiences in other parts of the world where initially tractor horsepower was often smaller such as asia or farmers were better endowed with land and wealth such as latin america in nigeria joint ownership of tractors is rare and formal loans are often unavailable due to high transactions costs ifpri's survey in kaduna and nasarawa states in 2013 suggested that the spatial mobility of tractors is generally low and the use of tractors is highly seasonal there do not seem to be plausible explanations for the seeming dominance of large tractor use based on available information on prices and soils nevertheless these patterns seem driven by the own initiative of the private sector rather than by government policies indivisibility of large tractors and limited mobility of supplies may cause imperfections in the custom tractor hiring market in order to distinguish the impacts of technology adoption at the extensive margin from those at the intensive margin in the empirical analyses for the research presented here we tested these hypotheses focusing on the differences among marginal adopters of tractor hiring services and non adopters with similar characteristics the results are three fold 1 adoptions patterns of tractor services are partly explained by basic factor endowments suggesting that the market for custom hiring is in some way functioning efficiently in response to economic conditions 2 adoptions are however affected by supply side factors including the presence of large farm households and thus potential tractor owners within the district and 3 per capita household expenditure level differs significantly between the marginal adopters and non adopters with similar characteristics this difference seems to arise from adoption per se rather than the intensity of adoption which is consistent with the hypothesis of imperfection in the custom tractor hiring market
