age fixed point to point microwave systems provide moderate capacity digital transmission between  
well defined locations most popular in situations where fiber optics or satellite communication is  
impractical it is commonly used for cellular or pcs site interconnectivity where digital connectivity is  
needed but not economically available from other sources and in private networks where reliability is  
most important until now no book has adequately treated all engineering aspects of microwave

when i attended college we studied vacuum tubes in our junior year at that time an average radio had ve vacuum tubes and better ones even seven then transistors appeared in 1960s a good radio was judged to be one with more thententransistors latergoodradioshad15 20transistors and after that everyone stopped counting transistors today modern processors runing personal computers have over 10milliontransistorsandmoremillionswillbeaddedevery year the difference between 20 and 20m is in complexity methodology and business models designs with 20 tr sistors are easily generated by design engineers without any tools whilst designs with 20m transistors can not be done by humans in reasonable time without the help of prof dr gajski demonstrates the y chart automation this difference in complexity introduced a paradigm shift which required sophisticated methods and tools and introduced design automation into design practice by the decomposition of the design process into many tasks and abstraction levels the methodology of designing chips or systems has also evolved similarly the business model has changed from vertical integration in which one company did all the tasks from product speci cation to manufacturing to globally distributed client server production in which most of the design and manufacturing tasks are outsourced
